

GCC Data Console

User's Manual

Overview

GCC Data Console has two screens: **Import**, where the two source CSV files are uploaded and validated, and **Records**, where the imported data can be filtered, sorted, and exported. This manual covers running the application locally and using both screens.

Requirements

Node.js 18 or later is the only prerequisite. The SQLite database file is created automatically the first time the server starts, so no separate database installation or setup is required.

Running the Application

1. Start the API server:

```
cd server
npm install
npm run dev
```

This starts the API at **http://localhost:4000**.

2. In a second terminal, start the frontend:

```
cd client
npm install
npm run dev
```

This opens the app at **http://localhost:5173**. The frontend automatically forwards its API requests to the backend, so no additional configuration is needed — just open that address in a browser.

Importing Data

Open the **Import** tab. Two upload zones are shown, one for each required file. Either click a zone to browse for a file or drag a CSV file onto it.

The Import screen, with both upload zones empty.

Required File Formats

Both files must match the expected column layout exactly — the same number of columns, in the same order, with the same header names shown below.

Coursera CSV — required columns (13)

Name, Email, External ID, Specialization, University, Enrollment Time, Last Specialization Time, # Completed Courses, # Courses in Specialization, Completed, Removed, Specialization Completion Time, Specialization Certificate URL

GCC Masterlist CSV — required columns (3)

Region, Name, Email

Once both files are selected, click **Validate & import**. The server checks the header row, then every data row, before writing anything to the database. Common checks include: required cells are not empty; email addresses and certificate URLs are well-formed; enrollment, last-specialization, and completion dates are valid dates; specialization matches one of the four GCC tracks; region matches a recognized DICT region code; and Completed/Removed are exactly “Yes” or “No”.

If any check fails, nothing is imported. Instead, a scrollable log lists every problem found, each one referencing which file, which row, and which column it belongs to, so the source file can be corrected and re-uploaded.

Duplicate Accounts

If the import succeeds but the same learner name appears with more than one email address, a dialog lists every affected name, email, region, and external ID before continuing to the Records screen. That list can be exported on its own as a CSV using the **Export duplicates CSV** button in the dialog. Duplicate accounts are reported for manual review only — the console does not merge or delete them automatically.

Importing a new pair of files replaces all previously imported records — the console keeps one active data set at a time.

Viewing and Exporting Records

Switch to the **Records** tab to browse the imported data.

Records

10 total records matching the current filters.

All specializations ▾All regions ▾Completed: any ▾Removed: any ▾Clear filters

The Records screen after an import, with the default (unfiltered) view.

Filtering

Four dropdowns above the table filter the list by specialization, region, completion status, and removed status. Filters combine — for example, choosing a specialization and a region narrows to learners matching both. **Clear filters** resets all four to “any”.

Sorting

Click a column header (Name, Region, Enroll time, Last specialization, or Completion time) to sort by that column; an arrow shows the current direction. Clicking the same header again reverses the sort order.

Pagination

Records are shown 20 at a time. When more than one page of results matches the current filters, **Previous** and **Next** buttons appear below the table along with the current page number.

Exporting

Export CSV and **Export Excel** both download every record matching the current filters and sort order (not just the visible page). Both formats add a computed **Time Elapsed** column showing the number of days between enrollment and last specialization activity.

Clearing Data

Clear all data permanently deletes every imported record after a confirmation prompt. Use this before importing a fresh data set if the previous one is no longer needed — note that a new import also replaces the existing records automatically, so this button is only needed to empty the console without importing new data.

Troubleshooting Common Validation Messages

Message	What it means
"This cell is empty"	A required column has no value in that row. Fill in the cell or remove the row.
"Not a valid email address"	The Email column doesn't contain a well-formed address.
"Not a valid date"	A date column (enrollment, last specialization, or completion time) isn't recognized as a date.
"Should be one of: ..."	A Specialization or Region value doesn't match one of the accepted values listed in the message.
"Contains unexpected characters"	A Name or University value has characters outside letters, spaces, hyphens, apostrophes, and periods.
"Column N should be ..., found ..."	The uploaded file's header row doesn't match the expected column name/order — check the file came from the correct export.
